

## Copper: Preliminary Data for April 2016

The International Copper Study Group (ICSG) released preliminary data for April 2016 world copper supply and demand in its July 2016 Copper Bulletin. The Bulletin is available for sale upon request.

In developing its global market balance, the ICSG uses an apparent demand calculation for China—the leading global consumer of copper accounting for about 45% of world demand—that does not take into account changes in unreported stocks [State Reserve Bureau (SRB), producer, consumer and merchant/trader]. To facilitate global market analysis, however, an additional line item—Refined World Balance Adjusted for Chinese Bonded Stock

Changes—is included below that adjusts the world refined copper balance based on an average estimate of changes in unreported inventories provided by three consultants with expertise in China's copper market. The resulting adjustments to world refined copper balance are discussed separately in italics below.

According to preliminary ICSG data, the refined copper market for April 2016 (excluding the adjustment for changes in China's bonded stocks) showed an apparent production deficit of around 110,000 metric tonnes (t) mainly due to strong Chinese apparent refined copper demand. When making seasonal adjustments for world refined production and usage, April showed a production deficit of about 32,000 t. The refined copper balance for the first four months of 2016, including revisions to data previously presented, indicates a production deficit of around 119,000 t (and a seasonally adjusted deficit of about 129,000 t). This compares with a production surplus of around 13,000 t (a seasonally adjusted surplus of about 12,000 t) for the same period of 2015.

In the first four months of 2016, world apparent refined usage is estimated to have increased by around 6% (460,000 t) compared with that in the same period of 2015 mainly due to strong Chinese apparent demand. Chinese apparent demand increased by around 14% based on a 30% increase in net imports of refined copper from the lower net import level in early 2015 and consequently lower apparent demand. Excluding China, world usage declined by around 1%. On a regional basis, usage is estimated to have increased by 6% in Europe and 9% in Asia (when excluding China, Asia usage declined by 3%), while declining by 20% and 4.5% in Africa and in the Americas respectively and remaining essentially unchanged in Oceania.

World mine production is estimated to have increased by around 4% (260,000 t) in the first four months of 2016 compared with production in the same period of 2015. Concentrate production increased by 5% while solvent extraction-electrowinning (SX-EW) remained essentially unchanged. The increase in world mine production was mainly due to a 51% rise in Peruvian output that is benefitting from new and expanded capacity brought on stream in the last two years. A recovery in production levels in Canada and the United States, expanded capacity in Mexico and a ramp-up in production in Mongolia also contributed to world growth. However overall growth was partially offset by a 4% decline in production in Chile, the world's biggest copper mine producer and a 13% decline in DRC where output is constrained by temporary production cuts. On a regional basis, production rose by 7% in the Americas and 4.5% in Asia but declined by 5% and 1% in Africa and in Oceania respectively while remaining essentially unchanged in Europe. The average world mine capacity utilization rate for the first four months of 2016 remains practically unchanged from that in the same period of 2015.

World refined production is estimated to have increased by about 4.5% (330,000 t) in the first four months of 2016 compared with refined production in the same period of 2015: primary production was up by 4% and secondary production (from scrap) was up by 5.5%. The main contributor to growth was China (+8%), followed by the United States where production increased by 18%. Output in Chile and Japan, the second and third leading refined copper producers, increased by 5% respectively. Refined production in the DRC and Zambia declined due to the impact of temporary production cuts. On a regional basis, refined output is estimated to have increased in the Americas (9%), Asia (7%) and Oceania (14%) while declining in Africa (-15%) and in Europe (-3%). The average world refinery capacity utilization rate for the first four months of 2016 increased to 84% from 82% in the same period of 2015.

*Based on the average of stock estimates provided by independent consultants, China's bonded stocks increased by around 140,000 t in the first four months of 2016 from the year-end 2015 level. Stocks increased by around 40,000 t in the same period of 2015. In the first four months of 2016, the world refined copper balance adjusted for the change in Chinese bonded stocks indicates a production surplus of around 21,000 t compared to a surplus of about 53,000 t in the same period of 2015.*

The average LME cash price for June was US\$4,630.64 per tonne, down from the May average of US\$4,708.35 per tonne. The 2016 high and low copper prices through the end of June were US\$5,103.00 (on 18<sup>th</sup> Mar) and US\$4,310.50 per tonne (on 15<sup>th</sup> Jan), respectively, and the year-to-date average was US\$4,700.58 per tonne (14.4% below 2015 annual average). As of the end of June, copper stocks held at the major metal exchanges (LME, COMEX, SHFE) totalled 401,005 t, a decline of 80,863 t (-17%) from stocks held at the end of December 2015. Compared with the December 2015 levels, stocks were down at the three exchanges.

Please visit the ICSG website [www.icsg.org](http://www.icsg.org) for further copper market related information.

(World Refined Copper Usage and Supply Trends table on next page)

### World Refined Copper Usage and Supply Trends, 2012-2016

Thousand metric tonnes, copper

	2012	2013	2014	2015	2015	2016	2016			
					Jan-Apr	Jan	Feb	Mar	Apr	
World Mine Production	16,766	18,246	18,492	19,132	6,134	6,396	1,580	1,519	1,685	1,613
World Mine Capacity	19,923	20,698	21,508	22,571	7,323	7,673	1,971	1,787	1,986	1,929
Mine Capacity Utilization (%)	84.2	88.2	86.0	84.8	83.8	83.4	80.2	85.0	84.8	83.6
Primary Refined Production	16,604	17,255	18,559	18,897	6,119	6,380	1,624	1,516	1,648	1,592
Secondary Refined Production	3,596	3,803	3,915	3,951	1,238	1,307	328	305	340	334
World Refined Production (Secondary+Primary)	20,201	21,059	22,474	22,848	7,357	7,688	1,952	1,821	1,988	1,927
World Refinery Capacity	24,784	26,104	27,045	27,291	8,949	9,119	2,349	2,126	2,358	2,286
Refineries Capacity Utilization (%)	81.5	80.7	83.1	83.7	82.2	84.3	83.1	85.7	84.3	84.3
World Refined Usage 1/	20,479	21,402	22,892	22,993	7,344	7,806	1,896	1,827	2,047	2,036
World Refined Stocks End of Period	1,376	1,325	1,343	1,541	1,561	1,558	1,617	1,633	1,647	1,558
Period Stock Change	171	-52	18	198	218	18	76	17	14	-89
Refined Balance 2/	-278	-343	-418	-145	13	-119	56	-6	-59	-110
Seasonally Adjusted Refined Balance 3/					12	-129	18	-55	-60	-32
Refined Balance Adjusted for Chinese bonded stock change 4/	289	-590	-441	-248	53	21	68	59	-14	-92

Due to the nature of statistical reporting, the published data should be considered as preliminary as some figures are currently based on estimates and could change  
1/ Based on EU apparent usage. 2/ Surplus/deficit is calculated using refined production minus refined usage. 3/ Surplus/deficit is calculated using seasonally adjusted refined production minus seasonally adjusted refined usage. 4/ For details of this adjustment see paragraph 2 of the press release.
